

StoryCrate

Tom Bartindale, May 2012

StoryCrate is a situated tangible interface developed alongside BBC Research and Development to explore how on-location human-resource can be leveraged to speed up the post-production process. The system is deployed on-location, and provides a basic linear multi-track editing capability and playback to the crew.

The system was deployed on-location at a shoot commissioned to test how such a system could integrate with existing film practice, particularly given existing practice prevents most crew members viewing footage on-location.

Technologies

- Custom built 4 display rear-projected tangible interface in a flightcase
- WPF / dotNET
